Task 1: Student Registration & Data Storage

Aim

To design a Student Registration Form using HTML5 and CSS3, collect user details (Name, Email, Date of Birth, Department, Phone), store them in a database, and retrieve the stored data using SQL SELECT.

Algorithm

1. Start
2. Create an HTML form to collect student details:
    - Name
    - Email
    - Date of Birth
    - Department
    - Phone Number
3. Apply CSS3 styling to make the form visually appealing.
4. When the form is submitted:
    - Send data to the server using POST method
5. Connect to the database (MySQL).
6. Create a table students if it does not exist.
7. Insert the form data into the table.
8. Execute SQL SELECT query to retrieve stored data.
9. Display the retrieved data on the webpage.
10. Stop

Code

1. HTML + CSS (index.html)

HTM

```
<!DOCTYPE html>
<html>
<head>
    <title>Student Registration</title>
    <style>
        body {
            font-family: Arial;
            background: #f2f2f2;
        }
        .container {
            width: 400px;
            margin: auto;
            background: white;
            padding: 20px;
            border-radius: 10px;
        }
        input, select {
            width: 100%;
            padding: 8px;
            margin: 10px 0;
        }
        button {
            background: blue;
            color: white;
            padding: 10px;
            border: none;
            width: 100%;
        }
    </style>
</head>
<body>

<div class="container">
    <h2>Student Registration</h2>
    <form action="register.php" method="POST">
        <input type="text" name="name" placeholder="Name" required>
        <input type="email" name="email" placeholder="Email" required>
        <input type="date" name="dob" required>

        <select name="department">
```

```
            <option value="CSE">CSE</option>
            <option value="IT">IT</option>
            <option value="ECE">ECE</option>
            <option value="EEE">EEE</option>
        </select>

        <input type="text" name="phone" placeholder="Phone Number" required>
        <button type="submit">Register</button>
    </form>
</div>

</body>
</html>
```

2. PHP + MySQL (register.php)

PHP

```
<?php
$conn = new mysqli("localhost", "root", "", "college");

if ($conn->connect_error) {
    die("Connection failed: " . $conn->connect_error);
}

// Create table
$sql = "CREATE TABLE IF NOT EXISTS students (
    id INT AUTO_INCREMENT PRIMARY KEY,
    name VARCHAR(50),
    email VARCHAR(50),
    dob DATE,
    department VARCHAR(10),
    phone VARCHAR(15)
)";
$conn->query($sql);

// Insert data
$name = $_POST['name'];
$email = $_POST['email'];
$dob = $_POST['dob'];
$department = $_POST['department'];
$phone = $_POST['phone'];

$sql = "INSERT INTO students (name, email, dob, department, phone)
        VALUES ('$name', '$email', '$dob', '$department', '$phone')";
```

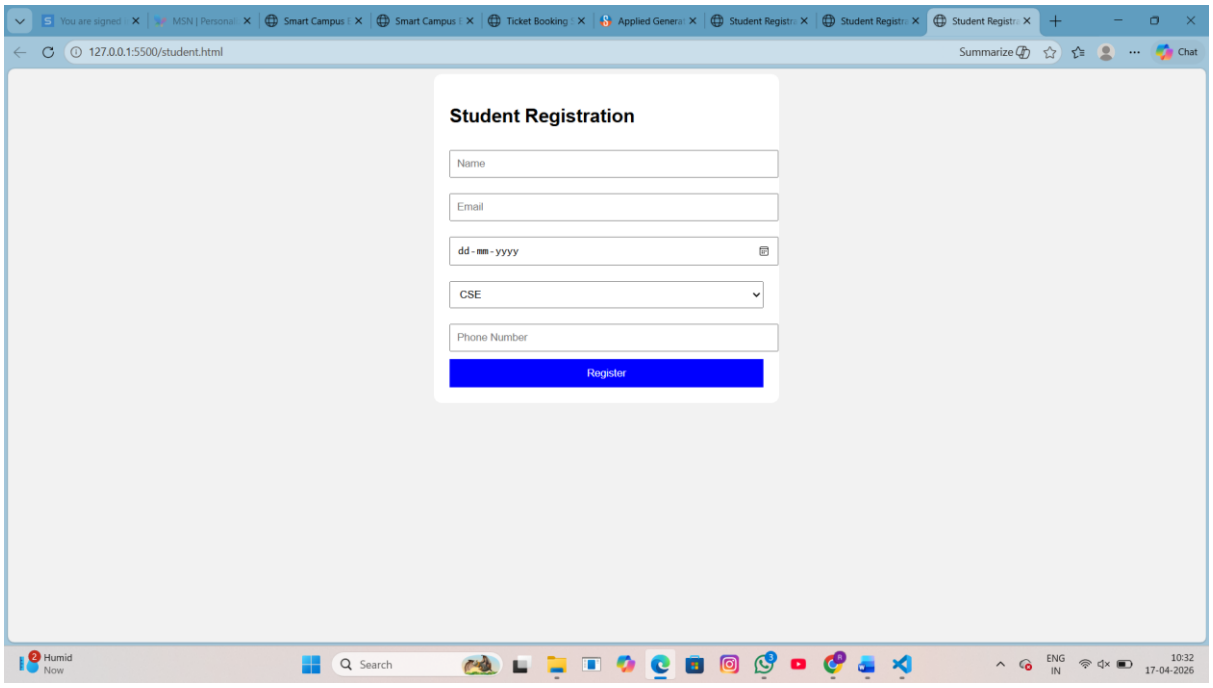
```
$conn->query($sql);

// Retrieve data
$result = $conn->query("SELECT * FROM students");

echo "<h2>Registered Students</h2>";
while ($row = $result->fetch_assoc()) {
    echo "Name: " . $row['name'] . "<br>";
    echo "Email: " . $row['email'] . "<br>";
    echo "DOB: " . $row['dob'] . "<br>";
    echo "Department: " . $row['department'] . "<br>";
    echo "Phone: " . $row['phone'] . "<br><hr>";
}

$conn->close();
?>
```

Output:



Result :

The Student Registration Form was successfully created using HTML5 and CSS3. The entered data was stored in a MySQL database and retrieved using the SQL SELECT query, displaying all registered student records.
